

Learning PyPDFLoader

PyPDFLoader is a LangChain document loader that extracts text from PDF files and returns one Document per page by default.

Installation

```
pip install langchain langchain-community pypdf
```

Basic Example

```
from langchain_community.document_loaders import PyPDFLoader
```

```
loader = PyPDFLoader("sample.pdf")  
docs = loader.load()
```

```
for d in docs:  
    print(d.page_content)  
    print(d.metadata)
```

Useful Methods

load(): load all pages.

lazy_load(): iterate page-by-page.

load_and_split(): load and split text into chunks (older pattern; usually combine with a text splitter).

Metadata

Each Document includes metadata such as source and page number.

Best Practice

Use RecursiveCharacterTextSplitter after loading before creating embeddings for RAG.
